

Part I

1. (Section 1) I enjoyed reading about the potential of mathematics to provide joy even through all of the struggles. Although I have not been able to solve exercise 1.1, I hope to solve it eventually.
(Section 2) I learned to always write in complete sentences in math, and that you should not use pronouns like "it" or "that's" or "this" but rather you should describe everything thoroughly in terms of what you are examining (i.e. specific variables).
(Section 3) I learned that we must build on our definitions and assumptions in Mathematics, starting from integers, even and odd, and prime and composite, along with relations and properties. I enjoyed learning about divisors, which provides a definition that we can continue to use to provide further definitions and to prove future theorems.
(Section 4) I learned that in Mathematics, true must always be absolute, unconditional, and without exception. I enjoyed learning about vacuous truths, which may not initially intuitively seem to be true, but due to the nature of the statement must be true.
2. I used the following link to learn how to use `enumitem` to create custom enumerations:
tex.stackexchange.com
I also used the following link to verify how to write double negation elimination rules:
[Wikipedia: Double negation](https://en.wikipedia.org/wiki/Double_negation)

I went to OH held by Yoda and Gizem and received help on format, as well as questions I had about Part III (3.3, 4.1, 4.3, 4.4 and 4.5) on language and clarification on definitions. I also asked questions in regards to how to write concise conclusions for 4.3, 4.4, and 4.5.

Part II

	M	T	W	Th	F	Sa	Su
Lion	F	F	F	T	T	T	T
Unicorn	T	T	T	F	F	F	T

- a = Today is a truth day for Lion.
 b = Yesterday was a lying day for Lion.
 c = Today is a truth day for Unicorn.
 d = Yesterday was a lying day for Unicorn.

If a , then b when today is Thursday.
 If $\neg a$, $\neg b$ when today is Monday.

If c , then d when today is Sunday.
 If $\neg c$, then $\neg d$ when today is Thursday.

So, the possible days are when a and $\neg c$ and today is Thursday.

- a = Yesterday was a lying day for Lion.
 b = 2 days from tomorrow will be a lying day for Lion.
 c = Today is a truth day for Lion.

If c , then a and b , and no days are possible.

If $\neg c$, then $\neg(a \text{ or } b)$ and:
 a and $\neg b$ when today is Tuesday or Wednesday.
 $\neg a$ and b is not possible.
 $\neg a$ and $\neg b$ when today is Monday.

So, the only possible days are Monday, Tuesday, or Wednesday.

- a = Yesterday was a lying day for Lion.
 b = Tomorrow was a lying day for Lion.
 c = Today is a truth day for Lion.

If c , then a and b , and no days are possible.

If $\neg c$, then $\neg(a \text{ or } b)$ and:
 a and $\neg b$ when is not possible.
 $\neg a$ and b when today is Monday.
 $\neg a$ and $\neg b$ is not possible.

So the possible days are Monday or Wednesday.

4. a = The Lion lied yesterday and will lie again tomorrow.
 b = Today is a truth day for Lion.

If b , then a and no days are possible.

If $\neg b$, then $\neg a$, and no days are possible.

So, there are no days where the statement can be true.

Part III

- (3.1) (a) If $3 \mid 100$, there exists an integer c such that $3c = 100$. There is no such integer, thus $3 \nmid 100$ and 100 is not divisible by 3.
- (b) If $3 \mid 99$, there exists an integer c such that $3c = 99$. There is such an integer, $c = 33$, so we say $3 \mid 99$ or 3 is a divisor of 99.
- (c) If $-3 \mid 3$, there exists an integer c such that $-3c = 3$. There is such an integer, $c = -1$, so we say $-3 \mid 3$ or -3 is a divisor of 3.
- (d) If $-5 \mid -5$, there exists an integer c such that $-5c = -5$. There is such an integer, $c = 1$, so we say that $-5 \mid -5$ or -5 is a divisor of -5.
- (e) If $-2 \mid -7$, there exists an integer c such that $-2c = -7$. There are no such integers, so we say $-2 \nmid -7$ or -2 is not a divisor of -7.
- (f) If $0 \mid 4$, there exists an integer c such that $0c = 4$. There are no such integers, so we say that $0 \nmid 4$ or 0 is not a divisor of 4.
- (g) If $4 \mid 0$, there exists an integer c such that $4c = 0$. There is such an integer, $c = 0$, so we say that $4 \mid 0$ or 4 is a divisor of 0.
- (h) If $0 \mid 0$, there exists an integer c such that $0c = 0$. There is such an integer, $c = 0$, so we say that $0 \mid 0$ or 0 is a divisor of 0.
- (3.3) (a) 21 is not a prime number because it has a divisor other than 1 and itself, namely $3 \mid 21$ and $7 \mid 21$.
21 is a composite number because there exists such an integer x such that $1 < x < 21$ and $x \mid 21$, namely $x = 3$ and $x = 7$.
- (b) 0 is not prime because it is not greater than 1 and has a divisor other than 1 and itself, namely $0 \mid 0$.
0 is not a composite number because there does not exist such an integer x such that $1 < x < 0$ and $x \mid 0$.
- (c) π is not prime because π is not an integer and prime numbers must be integers.
 π is not a composite because there exists no integer x such that $1 < x < \pi$ and $x \mid \pi$.
- (d) $\frac{1}{2}$ is not prime because $\frac{1}{2}$ is not an integer.
 $\frac{1}{2}$ is not a composite number because there exists no integer x such that $1 < x < \frac{1}{2}$.

- (e) -2 is not prime because -2 is not greater than 1.
-2 is not a composite because there exists no integer x such that $1 < x < -2$ and $x \mid -2$.
- (f) -1 is not prime because -1 is not greater than 1.
-1 is not composite because there exists no integer x such that $1 < x < -1$ and $x \mid -1$.
- (4.1) (a) If there exists a integer z , an odd integer x , and an even integer y such that $z = x \times y$, then z is an even integer.
- (b) If there exists a integer y and an odd integer x such that $y = x^2$, then y is an odd integer.
- (c) If there exists a integer y and a prime number x such that $y = x^2$, then y is not a prime number.
- (d) If there exists a integer z , a negative integer x , and a negative integer y such that $z = x \times y$, then z is a negative integer.
- (4.3)

A	B	A\RightarrowB	B\RightarrowA
T	T	T	T
T	F	F	T*
F	T	T*	F
F	F	T*	T*

* denotes vacuous truth

- (Condition 1.) A = I am in Ball Arena.
 B = I am in Colorado.
 $A \Rightarrow B$ and $B \nRightarrow A$.
- (Condition 2.) A = There are 8 continents.
 B = Pluto is not a planet.
 $A \Rightarrow B$ is vacuously true and $B \nRightarrow A$.

- (4.4) (a) If A , then B .
(b) $\neg A$ or B .

A	B	$\neg A$	A\RightarrowB	$\neg A$ or B
T	T	F	T	T
T	F	F	F	F
F	T	T	T*	T
F	F	T	T*	T

* denotes vacuous truth

Statement (a) is true when A and B , and is vacuously true when A and $(B \text{ or } \neg B)$. Statement (a) is false when A and $\neg B$.

Statement (b) is true when $\neg\neg A$ and B , and $\neg A$ and $(B \text{ or } \neg B)$. Statement (b) is false when $\neg\neg A$ and $\neg B$.

Therefore, for each equivalent input for Statement (a) and Statement (b), the same output was received. This implies a equivalency in the two statements.

- (4.5) (a) If A , then B .
(b) If $\neg B$, then $\neg A$.

A	B	$\neg A$	$\neg B$	$A \Rightarrow B$	$\neg B \Rightarrow \neg A$
T	T	F	F	T	T*
T	F	F	T	F	F
F	T	T	F	T*	T*
F	F	T	T	T*	T

* denotes vacuous truth

Statement (a) is true when A and B , is vacuously true when A and $(B \text{ or } \neg B)$.

Statement (a) is false when A and $\neg B$.

Statement (b) is true when $\neg A$ and $\neg B$, and vacuously true when $\neg B$ and $(\neg A \text{ or } \neg\neg A)$.

Statement (b) is false when $\neg B$ and $\neg\neg A$.

Although Statement (a) and Statement (b) differ as to when they are vacuously true, they are essentially identical in that the same output was received for each equivalent input.
